

Nexora Technologies — VPN Troubleshooting Runbook

Synthetic portfolio document for the ResolveAI enterprise knowledge assistant. Fictional content for learning and demonstration.

Purpose

This runbook helps employees troubleshoot common corporate VPN connection and authentication problems.

VPN fails after a password change

After changing a corporate password, the VPN client may continue using cached credentials. Sign out of the VPN client, close it, restart the application, and authenticate again with the new password. If the client still fails, remove the saved corporate credential from the operating system credential manager and retry.

MFA authentication failure

Verify that the device time is synchronized automatically. Check that the correct MFA method is being used. If push notifications do not arrive, use the current one-time code from the approved authenticator application.

Connection timeout

Check that the device has an active internet connection. Try reconnecting from a different approved network if permitted. If the issue persists, collect the exact VPN error message and contact the IT Service Desk.

When to escalate

Escalate repeated authentication failures, suspected service outages, or issues affecting multiple employees.
